

The Setup

A freelancer just handed you their financial records for Q1 2025. It's a mess.

Your task: build a tool that turns records like these into a clear overview the freelancer can actually use.

The records are raw – expect to parse, clean, and transform them before they're useful. You decide what the overview contains, how the tool works, and how far to take it. We care about your choices as much as your code.

RPG's stack: Python, JavaScript, REST APIs, SQL, Git. If you reach for LLMs, OCR, or browser/desktop packaging, stick to open-source models that run locally; no external APIs, no sign-ups.

What You're Given

A folder called `shoebox/` containing everything the freelancer dumped on you:

- Business credit card statement
- Receipts
- A spreadsheet of invoices
- `notes.txt`

Rules

- 48 hours from when you receive this.
- No external APIs, no sign-ups. We clone, we run, we evaluate.
- Public GitHub repo.
- Include a README: what you built, why, how to run it, and if you were given another month and access to paid APIs – where would you take this?

When you're done, email the repo link to marcelo@readyplango.com. Questions are encouraged - same address, anytime.

What We're Evaluating

Signal	What we're looking for
Judgment	What you chose to build and why. How you scoped for 48 hours.
Attention to detail	How thoroughly you explored and handled the data you were given.
Code quality	Clean, modular, runnable. Something we'd want to maintain.
Creativity	Your approach to the hard parts.
Communication	Your README. The questions you asked (or didn't).

Good luck, have fun!
- The RPG team
